The EMA protects Terrestrial Biodiversity

Trinidad's terrestrial biodiversity is of South American origin. Because of this, we have a higher species richness than many Caribbean islands, but a low number of species that are found only in our twin island state. Like marine life, terrestrial organisms are also sensitive to climatic changes such as global warming. Did you know that changing climatic patterns, along with human activities, affect the flowering of plants and the migration patterns of animals?

Our diverse landscape has more than just aesthetic value. It also contributes to good air quality, fresh water and sustains our ecosystems and food chains. Our terrestrial

diversity enhances our daily lives in many ways. It is our responsibility to ensure that while they serve us, we strive to protect them as well

Dates to remember:

- 16 September - World Ozone Day
- 18 September - International Coastal Clean Up Day
- 27 September - Tourism Day
- World Maritime Day: to be declared (last week of September)
